

1. Interpolation ({{ }})

ही Angular मधली सर्वात basic आणि जास्त वापरली जाणारी Data Binding type आहे.

Interpolation म्हणजे काय?

TypeScript मधील data HTML मध्ये show करणे.

Syntax

{{variableName}}

Example

app.component.ts

```
export class AppComponent {  
  
  name = "Gaurav";  
  
}
```

app.component.html

```
<h1>{{name}}</h1>
```

Output

Gaurav

Internally काय होतं?

Angular:

- TypeScript मधून **name** variable घेतो
 - HTML मध्ये display करतो
-

Multiple Values Example

TS

```
name = "Gaurav";
```

```
age = 21;
```

```
city = "Pune";
```

HTML

```
<h1>{{name}}</h1>
```

```
<h2>{{age}}</h2>
```

```
<h3>{{city}}</h3>
```

Expressions पण वापरू शकतो

```
<h1>{{10 + 20}}</h1>
```

Output:

```
30
```

String Combine

```
<h1>
```

```
Welcome {{name}}
```

```
</h1>
```

Output:

Welcome Gaurav

Method Call करू शकतो

TS

```
getName(){  
  return "Rahul";  
}
```

HTML

```
<h1>{{getName()}}</h1>
```

Important Point

Interpolation फक्त:

- Data show करण्यासाठी वापरतात

✗ HTML events साठी नाही

✗ Input binding साठी नाही

Real Life Example

समज:

Teacher attendance बोलतो:

Gaurav

Rahul

Amit

Board वर नाव show होतं.

तसंच Angular मध्ये:

Most Used Places

Use	Example
Name Show	<code>{{name}}</code>
Price Show	<code>{{price}}</code>
API Data Show	<code>{{student.name}}</code>
Count Show	<code>{{total}}</code>

Interview Definition

Interpolation is a one-way data binding technique used to display TypeScript data in the HTML template using double curly braces `{{ }}`.

One Line Memory Trick

Interpolation = TS data HTML मध्ये show करणे

Interpolation Assignment (Angular)

Topic:

Interpolation `{{ }}`

Assignment 1 → Basic Variables Show

app.component.ts

```
export class AppComponent {  
  
  name = "Gaurav";  
  
  age = 21;  
  
  city = "Pune";  
  
}
```

Task

HTML मध्ये खालील show करा:

Name : Gaurav
Age : 21
City : Pune

Assignment 2 → Student Information

TS

```
export class AppComponent {  
  
  studentName = "Rahul";  
  
  course = "Angular";  
  
  fees = 25000;  
  
}
```

Task

Output:

Student Name : Rahul

Course : Angular

Fees : 25000

Assignment 3 → Mathematical Expression

Task

Interpolation वापरून:

10 + 20

50 - 10

5 * 5

100 / 2

चे output HTML मध्ये show करा.

Expected Output

30

40

25

50

Assignment 4 → Welcome Message

TS

name = "Gaurav";

Task

Output:

Welcome Gaurav

Assignment 5 → Method Call

TS

```
getCollege(){  
  
    return "SNJB College";  
  
}
```

Task

HTML मध्ये method call करून output show करा.

Expected Output

SNJB College

Assignment 6 → Product Details

TS

```
product = "Laptop";  
  
price = 55000;  
  
brand = "HP";
```

Task

Output:

Product : Laptop
Price : 55000
Brand : HP

Bonus Assignment

TS

```
firstName = "Gaurav";
```

```
lastName = "Sandhan";
```

Task

Output:

Full Name : Gaurav Sandhan

Hint:

```
{{firstName}} {{lastName}}
```

Practice Goal

या assignment मधून तुला समजेल:

- ✓ Variable show करणे
 - ✓ Expressions वापरणे
 - ✓ Method call करणे
 - ✓ String combine करणे
 - ✓ TS → HTML data flow
-

Most Important Rule

Interpolation = One Way Data Binding

म्हणजे:

- TS → HTML

- HTML → TS नहीं.
